Payroll Basics (PY-XX-BS)

Purpose

The Payroll is based on an international payroll driver. This payroll driver was modified for each country. The country-specific payroll drivers take the statutory and administrative regulations of a country into account.

Since the payroll driver has a modular structure, you can use the Customizing functions to quickly modify the payroll procedure to meet the particular requirements of your enterprise.

Process Flow

When you access Payroll, the payroll driver calls the accompanying payroll schema, which consists of a sequence of functions. For each activity, the individual functions import data from internal tables and payroll relevant files.

Payroll is then performed as follows:
1. The system updates the databases and imports the master data relevant to payroll.
2. If Off-Cycle Payroll [Ext.] is to take place, the system deletes the internal table IT.
3. The system imports the last payroll result.
4. The system calculates the gross wage and considers the shift schedule, shift change compensation, and valuation bases. Any master data relevant to payroll is included in the calculation at this point.
5. The system calculates the partial period factors, lump sums and salary elements, and cumulates the gross results.
6. The system calculates the net remuneration and performs retroactive accounting if specific master data has been changed in previous payroll periods.

Result

After the payroll run, you can transfer the payroll results to Financial Accounting, or perform evaluations and create lists and statistics.
Payroll Driver

Definition
Special report for Payroll. SAP has developed country-specific payroll drivers, which are based on report RPCALCx0. With country-specific reports the penultimate character in the name refers to the country indicator (for example, D for Germany, F for France).

Use
Report RPCALCx0 can calculate periodic payments and also off-cycle payroll runs. However, this report does not include tax and social insurance data for net wage calculations. The country specific payroll drivers contain this data.

Integration
Calculation rules and other reports are stored in an accompanying schema [Page 7] which also contains the activities carried out by the payroll driver during payroll. All data is stored in internal tables [Page 9] and saved in files [Page 8] with a cluster structure.
Payroll Schema

Definition
The payroll schema contains calculation rules to be used by the payroll driver during payroll. SAP has developed country-specific schemas which are based on schema X000. With country-specific reports, the first character in the name refers to the country indicator (for example, D for Germany, F for France).

Structure
A schema consists of the following parts:

- Initialization
  The system performs the following steps:
  - Updates the databases
  - Imports required infotypes
- Gross calculation of pay
  The system performs the following steps:
  - Processes basic data and time data
  - Queries off-cycle payroll runs
  - Reads payroll account of the last period accounted
  - Processes time data and calculates the individual gross values
  - Performs factoring
- Net calculation of pay
  The system performs the following steps:
  - Calculates net remuneration
  - Performs bank transfers

Integration
All data is stored in internal tables and saved in files with a cluster structure.
Payroll Relevant Files

Definition
Payroll files contain data for payroll and payroll results.

Structure
The system requires the following files for payroll:

- Pnnnn (nnnn = number of the infotype)
  The Pnnnn files contain data that has been entered in the respective infotypes for an employee.

- PCL1
  The PCL1 file contains primary information, in other words, data from the master data and time recording systems.

- PCL2
  The PCL2 file contains secondary information, in other words, derived data and all generated schemas.

Integration
When you start payroll, the system imports the relevant master data from the Pnnn files (for example, basic pay and tax class) and imports the time data from the PCL1 file to the IT table. The system imports the payroll results from the previous month from table ORT (for example, to form averages). The system processes this data and saves the payroll results and generated schemas in the PLC2 file.
Internal Tables

Definition
Internal tables store data during payroll. The system imports data to these tables and used them to calculate new data. This data is then also saved in internal tables.

Structure
At the start of the payroll run, the system reads the values from the results tables to the old results table (ORT). Data from the previous period is, therefore, available in the current payroll period.

The most important internal tables are:

- **Input table (IT)**
  Table IT contains data that can be edited. The table exists only during processing.

- **Output table (OT)**
  Table OT contains the results of an activity. These results are written to the input table for further processing. The table exists only during processing.

- **Results table (RT)**
  Table RT contains the results of the period for which payroll has been run. The system saves this data in the PCL2 file in cluster RX.
Payroll Control

Use
This function is used to control Payroll.

During Payroll the master data for the personnel numbers to be included in the payroll run can not be changed for the past or present, for example.
You should not perform payroll, when master data is being processed for the personnel numbers for which payroll should be run.

Scope of Function

- Payroll Control Record [Page 11]
- Payroll Area [Page 17]
- Payroll Status [Page 13]
- Payroll Period [Page 18]
Payroll Control Record

Definition

Payroll object that is important for the payroll run, and which contains all the information on a payroll area [Page 17].

Use

The payroll control record [Ext.] has the following functions:

- It locks the personnel numbers, for which payroll should be run, against master data changes that affect the payroll past or present.
- It locks the payroll for the period during which payroll-relevant changes are made to the master data for the personnel numbers being processed.
- It makes the following information available for the system:
  - What is the next payroll period for which regular payroll should be run?
  - Up to what date is retroactive accounting [Page 25] carried out?
  - What status does the payroll currently have? (for example, Released for Payroll or Check Payroll Results)?

When you carry out a payroll run, the system automatically changes the payroll status in the payroll control record. You can also change the status manually under Payroll → Tools → Control Record.

Structure

The control record contains the following information:

- Payroll area
- Payroll status
- Payroll period
- Earliest possible retroactive accounting period [Page 27]
- Last change made to the control record

⚠️

When you create the control record in your live system, please note the following: the payroll period that you enter at the start of the live payroll run must be 1 period lower than the period with which you want to perform the live payroll run for the first time.

You want to carry out the first payroll run in period 5 1999. In the payroll control record, you must enter 4 1999 as the period. If you set the payroll control record for the first payroll run to status Released for Payroll, the system increases the period by 1 and payroll is run for period 5 1999.
Payroll Status (Infotype 0003)

Definition
Infotype in which data on the Payroll status and Time Management status is stored.

For example, the system stores the date of the last payroll run performed for the employee in the Payroll Status infotype (0003).

The system can flag an employee that was rejected in the payroll run.

Use
The system automatically creates this infotype when the employee is hired. In general, the system updates the infotype and writes the changes to the payroll past.

Structure
You can change the payroll status of an individual employee using Payroll/Retroactive Accounting and Time Evaluation.

It is only worthwhile making such changes for a few exceptional cases. For more information, see Changing The Payroll Status [Ext.].
Editing the Payroll Status

Use

The *Payroll Status* infotype (0003) is usually updated by the system. An exception is manual editing of an employee’s payroll status. The following possibilities exist to edit the infotype.

- Editing Master Data
  Here, you can edit part of a field.

- Enhanced Editing
  Here, you can edit all fields.

Prerequisites

Editing Master Data

You are authorized to edit master data.

Enhanced Editing

During the enhanced maintenance of the *Payroll Status* infotype (0003), you can exclude employees from the payroll run and delete employees from the payroll correction run [Ext]. Since such changes are particularly critical, you need special authorization for extended editing of the infotype. If you do not have this authorization, contact your system administrator.

Procedure

Editing Master Data

1. Choose *Human Resources* → *Personnel Management* → *Administration* → *HR Master Data* → *Maintain*.

2. Enter the personnel number and infotype 0003, and select 🆕.
   You can edit the following fields:
   - *Earl. Pers. RA* (Earliest Possible Personnel Retroactive Accounting Date)
   - *Run Payroll Up To*
   - *Do Not Account After*
   - *Personnel Number Locked*

   For more information on this field, see [locked personnel numbers][Page 16].

Enhanced Editing

1. Choose *Human Resources* → *Payroll* → `<Country>` → *Tools* → *Maintain Payroll Status*.
The Change Payroll Status screen appears.

2. Enter the personnel number and choose 🔄.

You can enter data in all fields of the Payroll Status (0003) infotype.
Locked Personnel Numbers

In the Payroll Status infotype (0003) you can exclude an employee from the payroll run by flagging the Pers.no. locked field.

You can not set these lock indicators for the current period in the following situations:

- if payroll has already been completed for the current payroll period.
- if the employee has already been paid in the current payroll period.
Payroll Area

Definition
A group of employees for whom payroll should be run together, and at the same time.

Use
You can perform the Payroll separately for different employee groups, using different payroll areas [Ext.]. This is necessary if the payroll period [Page 18] is not the same for all employee groups.

Salaried employees in your enterprise receive their salary at the end of the month. Hourly wage earners receive their remuneration in the middle of the subsequent month.

You can also group together all employees in one payroll area that should not be included in the payroll run. To do so, you create a payroll area for which you do not select the Run payroll indicator.

When you run payroll, you must specify the payroll area in the payroll driver [Page 6] selection screen. The payroll area has the following functions:

- In the Payroll Period block it is used to determine the exact payroll period.
- In the Selection block it is used to select the personnel numbers that should be grouped together during the payroll.

Structure
The payroll area contains the following information:

- Payroll area text
- Period parameters [Ext.]
- Run payroll until indicator
- Date modifier [Ext.]

Integration
Every payroll area needs its own payroll control record [Page 11].
Specific Payroll Dates

Definition

Exact period in which the regular payroll is carried out.

14-day payroll periods have been defined for your enterprise. The first period begins on 01 January. If you carry out Payroll for payroll period 09, the specific payroll date is 01 through 15 May.

Use

In regular payroll, payroll is always run for a payroll period. The system determines the specific payroll dates. It also checks if retroactive accounting [Ext.] is necessary.

In the case of Off-Cycle-Payroll [Ext.] the specific payroll period can be a day. In the case of bonus accounting, the payment date that you use to start the off-cycle payroll is both the start date and the end date of the payroll period. The system generates the payroll result for this day.

For further information see Off-Cycle-Activities [Ext.].

In the case of regular payroll, the method used to define the specific payroll period is dependent on whether you are carrying out a test run or a live payroll run:

- For a test run, you generally enter the specific payroll period
- For a live payroll run, the system uses the value that is in the payroll control record [Page 11] as the current payroll period

In the payroll driver [Page 6] selection screen, enter the payroll area [Page 17] for which you want to run payroll. The system derives the exact start and end date of the payroll for this payroll area, using the following parameters, which are stored in the payroll area or in the payroll control record:

- In the payroll area
  - Period parameters [Page 19]
  - Date modifier [Page 20]
- In the appropriate payroll control record
  - Payroll period [Page 21]
Period Parameters

Definition
A two-digit numerical parameter that determines the time interval for which payroll is run for a payroll area.

If you assign the period parameter [Ext.] 01 to the payroll area Salaried Employee, payroll is run monthly for this payroll area. If you assign the period parameter 03 to the payroll area Industrial Employee, payroll is run weekly for this payroll area.

Use
The SAP standard system contains period parameters for all the common payroll periods for different countries. However, if you need an individual period parameter for your system, specify this in Customizing for Payroll under Environment → Payroll Organization → Define Period Parameters [Ext.].

In Customizing for Payroll under Environment → Payroll Organization → Check Payroll Area [Ext.] you assign a period parameter to every payroll area in your system. In this way you determine how frequently regular payroll should be run for this payroll area. You can assign the same period parameter to all payroll areas, if the payroll periods are the same for all employees in your enterprise.

In your system, you must use Report RPUCTP00 (Generation of Payroll Periods) to generate the payroll periods for every period parameter that you have assigned to a payroll area. In this way you determine the concrete start and end date for each period, as well the payday. You generate the payroll periods in Customizing for Payroll under Environment → Payroll Organization → Generate Payroll Periods [Ext.].

When you start payroll, enter the payroll area for which you want to run payroll on the payroll driver selection screen. The system derives the payroll period from the period parameter you assigned to this payroll area.

Integration
If you want to specify different date specifications, for example different paydays, for a period parameter, then you also have to define a date modifier [Page 20].
Date Modifier

Definition
Differentiator that you use to determine different paydays for different employees for whom payroll is run with the same periodicity.

Payroll is run monthly in your enterprise. The payday is the 15th of the month for industrial employees and the 25th for salaried employees. Since the payroll periodicity (monthly) is the same for both groups of employees, the system requires two date modifiers [Ext.] as differentiators to be able to determine different paydays.

Use
You determine the date modifiers in Customizing for Payroll under Environment → Payroll Organization → Define Date Modifiers [Ext.].

You assign a date modifier to every payroll area in your system in Customizing for Payroll, under Environment → Payroll Organization → Check Payroll Area [Ext.].

- If you use the same payday for all payroll areas, assign the SAP standard modifier to all payroll areas.
- If you use different paydays for different payroll areas, assign different date modifiers to these payroll areas that you have created for your enterprise.

In your system, you must generate the payroll periods separately using Report RPUCTP00 (Generation of Payroll Periods) for every combination of period parameters and date modifiers that you have assigned to a payroll area. You generate the payroll periods in Customizing for Payroll under Environment → Payroll Organization → Generate Payroll Periods [Ext.].

When you start payroll, enter the payroll area for which you want to run payroll on the payroll driver selection screen. The system recognizes, by means of the date modifier that you assigned to this payroll area, whether different date specifications exist for this payroll area.

Integration
A date modifier always refers to a period parameter [Page 19].
Payroll Period

Definition

The time interval for which the payroll is regularly performed. In the abstract sense the payroll period [Ext.] refers to the interval during which payroll is regularly performed. For example, weekly or monthly payroll periods. In the concrete sense the payroll period describes a specific period with start and end dates. For example, the (monthly) payroll period from 01 through 31 October.

Use

You specify the concrete payroll periods, with a period number, start and end date and pay day, for your enterprise in Customizing for Payroll under Environment → Payroll Organization → Generate Payroll Periods [Ext.], using Report RPUCTP00 (Generation of Payroll Periods). The generation of the payroll periods is dependent on the period parameter and the date modifier. The report enters the start and end date of every payroll period in Table T549Q (Payroll Periods) and enters the payday in Table T549S (Personnel Date Specifications Per Payroll Period).

The system automatically creates the payday for all countries when you generate the payroll periods. However, the payday only has a role to play in some countries. For example, if the bank transfer day of the original payroll run (as opposed to a retroactive accounting run) is important for tax purposes.

In some countries the payday is printed on the pay check. The employee can cash the check from this date.

When you start payroll, enter the payroll area for which you want to run payroll on the payroll driver selection screen. Using the payroll control record for this payroll area, the system determines the next period for which payroll is to be run. The procedure is as follows:

1. The system reads the current value that is contained in the Payroll Period field of the payroll control record.
2. Using this value the system reads the Previous Payroll Period field in Table T549Q (Payroll Periods).
3. The system determines which period follows this previous period in accordance with Table T549Q. This subsequent period is the current payroll period.
4. The system also determines the concrete start and end date of the payroll period in Table T549Q.

You have created this date specification with Report RPUCTP00.

Finally, the system reads the relevant infotypes using the date specifications for the start and end dates.

Integration

The payroll periods are defined in the SAP System and are dependent on the period parameter [Page 19].
Payroll Period

In your enterprise, the first payroll period for the year 2000 begins on 01 January. Depending on the period parameter you use as a basis, for example *weekly* or *monthly*, the payroll period 05 2000 can have the following meaning:

Period Number

Definition

A two-digit numerical parameter that, together with the date, clearly identifies a concrete payroll period [Page 21].

- The period number [Ext.] 08, together with the year 2000, denotes the eighth payroll period in the year 2000. It can depend on the system settings, for example, the calendar month August or the week from 14 through 20 February.

Use

In the payroll control record, the system continuously increases the period numbers of the payroll periods for a fiscal year. Every time you set the status of the payroll control record to Release for Payroll, the period number is increased by one. In this way the system identifies the current payroll period. At the start of a new fiscal year the period number is reset to 01.

The period number that a payroll period contains depends on the following criteria that you enter when generating the payroll periods:

- Period parameter (for example, weekly or monthly)
- Start of fiscal year
  - In most countries the fiscal year starts on 01 January. However, it starts on 06 April in the United Kingdom.
- Indicator for determining the period number
  - This indicator specifies the payroll period date the system should use to determine the period number.
    - Start date
    - End date
    - Payday

Example

Example 1

You make the following specifications when generating the payroll periods:

- Period parameter monthly
- Start of fiscal year 01 January
- Determine the period number depending on the end date of the payroll period.

In this case, the payroll period from 01 through 31 July, for example, has the period number 07 in your system.

Example 2

You make the following specifications when generating the payroll periods:
Period Number

- Period parameter *weekly*
- Start of fiscal year 01 January
- Determine the period number depending on the payday
  
  The payday should be four days after the end of the period.

In this case, the payroll period from 01 through 07 January, for example, has the period number 02 in your system. The period from 25 through 31 December of the previous year has the period number 01, because the payday for this period is 04 January.
Retroactive Accounting

Use

If you change the master or time data for an HR master record for a period for which payroll has already been run, the old payroll results must be checked in the next regular payroll run and the payroll run must be repeated. The system automatically creates a retroactive accounting run in the payroll past.

To ensure that not every change triggers a retroactive accounting run, the changes are checked for retroactive accounting relevance. This ensures that only those changes that require a correction of the payroll results, trigger a retroactive accounting run. Moreover, the system determines the retroactive accounting limit for which retroactive accounting can take place, from the Payroll Status infotype (0003) and the payroll control record.

Scope of Function

The retroactive run is limited by basic data:

- Payroll past
  
The payroll past includes all periods for which you have already run and exited payroll.

- Retroactive accounting limit
  
The retroactive accounting limit determines the date up to which you may change master and time data in the payroll past, and, in the case of a retroactive run, the earliest date to which the system can run retroactive accounting. The retroactive accounting limit always refers to personnel numbers.

You can change the retroactive accounting limit in the following ways:

- for an employee in the Earl. Pers. RA (Earliest Possible Personal Retroactive Accounting Date) field in the Payroll Status infotype (0003)
- for a payroll area in the Earliest Possible Retroactive Accounting Period field in the payroll control record (see Change Earliest Possible Retroactive Accounting Period [Page 28])

The system uses the following values to determine the retroactive accounting limit:

- for each payroll area, from the earliest possible retroactive accounting period that is stored in the corresponding payroll control record
- for each employee, from the earliest possible personal retroactive accounting date that is stored in the Payroll Status infotype (0003)
- for each employee, using the hiring date of the employee

The system uses these values to select the most recent date.

- Retroactive accounting relevance
  
You can determine the retroactive accounting relevance either per infotype or per infotype field. To determine which infotypes or fields are relevant to retroactive

Retroactive Accounting

accounting, see Customizing for Personnel Administration under Customize Procedures → Infotypes → Define Fields Relevant for Retroactive Accounting [Ext.].

If you edit infotypes that are relevant to retroactive accounting, you should take note of some particular features. For more information, see Payroll-Relevant Maintenance of HR Master Data [Ext.].

- Retroactive accounting recognition

If you maintain an infotype that is relevant to retroactive accounting and its validity period overlaps with the payroll past, the system enters the start date of the changed infotype in the Earliest MD Change (Earliest Master Data Change since Last Payroll Run) field of the Payroll Status infotype (0003). During the next payroll run the system automatically performs retroactive accounting up to this date. Afterwards, the system deletes the entry.

The Earliest MD Change field can also contain a date that occurs in the future. This date is entered in an off-cycle payroll run [Ext.].

If you have made at least one change in the payroll past that is relevant to retroactive accounting, the system checks the entry in the Earliest MD Change field and determines the date to which the retroactive accounting run must take place.
Earliest Possible Retroactive Accounting Period

Definition
The earliest period for retroactive accounting is the payroll period furthest in the past for which you can run retroactive accounting. This is stored in the payroll control record for the payroll area.

Use
This period is determined by your company. You can specify, for example, that retroactive accounting for the previous year is not possible after a particular date in the current year.
Changing the Earliest Possible Retroactive Accounting Period

Changing the Earliest Possible Retroactive Accounting Period

You can only change the earliest possible retroactive accounting period for a payroll area, whilst exiting payroll [Ext].

1. From the SAP Easy Access screen, choose Payroll → Payroll <Country> → Payroll → Tools → Control Record in the SAP menu.

2. Enter the payroll area for which you want to change the earliest possible retroactive accounting period and choose Change.

The earliest possible retroactive accounting period can only be changed, after you have set payroll status to Exit payroll and before you save the payroll control record.

3. In the Earliest retroactive accounting period field, enter your new earliest retroactive accounting period and save your entries.
### Transaction Codes for Payroll

In Payroll, you can use the following transaction codes:

#### Bases

<table>
<thead>
<tr>
<th>Transaction</th>
